

Abstrak

Health services or health care are the maintenance or improvement of health status through efforts to prevent, diagnose, therapy, recover or cure diseases, injuries, and other physical and mental disorders. Health services are provided professionally by health workers and health support workers, for example doctors, nurses, midwives, pharmacists, and their assistants. Health service activities are provided in primary, secondary and tertiary health facilities, and include public health (Nursalam 2018). This research uses a correlative type of research. Descriptive research aims to find a relationship between the independent variable and the dependent variable, namely the level of nurses' knowledge about triage and response time with basic life support. The approach used is a cross sectional approach, the researcher collects data on the dependent and independent variables together. The results of this research show that the majority of respondents aged 25-35 years were 18 (73.3%). according to (Notoatmodjo, 2012). Age influences a person's grasping power and thinking patterns, the older one gets, the more one's grasping power and thinking patterns develop, so that the abilities one acquires get better. In adulthood, trained health workers can carry out triage measures because adulthood is the time when a person reaches the peak of their intellectual abilities. Critical thinking abilities increase regularly during adulthood (Potter & Perry, 2015). The research results show that the majority of respondents aged 25-35 years were 18 (88%), male as many as 17 (77%), and female as many as 13 (23%), length of work 10-15 years as many as 7 (23, 3%). The majority of respondents have good triage skills, 16 (53.3%). The majority of respondents have good response time skills, 14 (46.7%). The majority of respondents carried out BHD according to the SOP, 25 (83.3%). There is a relationship between the level of triage nurse ability and BHD with a value of 0.014 ($p < 0.05$). There is a relationship between the level of nurse's ability regarding response time and BHD with a value of 0.031 ($p < 0.05$).

Kata kunci : Kemampuan perawat tentang triage dan respon time dengan BHD
